# 3 Introduction

Decomposing a system into modules is a commonly accepted approach to developing software. A module is a work assignment for a programmer or programming team (Parnas et al., 1984). We advocate a decomposition based on the principle of information hiding (Parnas, 1972). This principle supports design for change, because the "secrets" that each module hides represent likely future changes. Design for change is valuable in SC, where modifications are frequent, especially during initial development as the solution space is explored.

Our design follows the rules layed out by Parnas et al. (1984), as follows:

- System details that are likely to change independently should be the secrets of separate modules.
- Each data structure is implemented in only one module.
- Any other program that requires information stored in a module's data structures must obtain it by calling access programs belonging to that module.

After completing the first stage of the design, the Software Requirements Specification (SRS), the Module Guide (MG) is developed (Parnas et al., 1984). The MG specifies the modular structure of the system and is intended to allow both designers and maintainers to easily identify the parts of the software. The potential readers of this document are as follows:

- New project members: This document can be a guide for a new project member to easily understand the overall structure and quickly find the relevant modules they are searching for.
- Maintainers: The hierarchical structure of the module guide improves the maintainers' understanding when they need to make changes to the system. It is important for a maintainer to update the relevant sections of the document after changes have been made.
- Designers: Once the module guide has been written, it can be used to check for consistency, feasibility, and flexibility. Designers can verify the system in various ways, such as consistency among modules, feasibility of the decomposition, and flexibility of the design.

The rest of the document is organized as follows. Section 4 lists the anticipated and unlikely changes of the software requirements. Section 5 summarizes the module decomposition that was constructed according to the likely changes. Section 6 specifies the connections between the software requirements and the modules. Section 7 gives a detailed description of the modules. Section 8 includes two traceability matrices. One checks the completeness of the design against the requirements provided in the SRS. The other shows the relation between anticipated changes and the modules. Section 9 describes the use relation between modules.

# 4 Anticipated and Unlikely Changes

This section lists possible changes to the system. According to the likeliness of the change, the possible changes are classified into two categories. Anticipated changes are listed in Section 4.1, and unlikely changes are listed in Section 4.2.

## 4.1 Anticipated Changes

Anticipated changes are the source of the information that is to be hidden inside the modules. Ideally, changing one of the anticipated changes will only require changing the one module that hides the associated decision. The approach adapted here is called design for change.

**AC1:** The specific hardware on which the software is running.

**AC2:** The format of the initial input data.

...

## 4.2 Unlikely Changes

The module design should be as general as possible. However, a general system is more complex. Sometimes this complexity is not necessary. Fixing some design decisions at the system architecture stage can simplify the software design. If these decision should later need to be changed, then many parts of the design will potentially need to be modified. Hence, it is not intended that these decisions will be changed.

**UC1:** Input/Output devices (Input: File and/or Keyboard, Output: File, Memory, and/or Screen).

...

# 5 Module Hierarchy

This section provides an overview of the module design. Modules are summarized in a hierarchy decomposed by secrets in Table 1. The modules listed below, which are leaves in the hierarchy tree, are the modules that will actually be implemented.

**M1:** Hardware-Hiding Module

**M2:** Input Communication Module

**M3:** Output Communication Module

**M4:** Remote Access Module

**M5:** Current State Module

**M6:** File Output Module

**M7:** Graphical Output Module

**M8:** Calculation Module

**M9:** User Input Validation Module

**M10:** Hardware Input Validation Module

| **Level 1** | **Level 2** |

Table 1: Module Hierarchy

# 6 Connection Between Requirements and Design

The design of the system is intended to satisfy the requirements developed in the SRS. In this stage, the system is decomposed into modules. The connection between requirements and modules is listed in Table 2.

# 7 Module Decomposition

## 7.1 Hardware Hiding Modules (M1)

**Secrets:** The data structure and algorithm used to implement the hardware.

**Services:** This module provides the interface between the hardware and the software. So, the system can use it to display outputs or to accept inputs.

**Implemented By:** OS

## 7.2 Behaviour-Hiding Module

### 7.2.1 Communication Module

**Secrets:** Format input and output data and manage remote connection communication.

**Services:** Converts the data into the appropriate data structure used by the input/output parameters module. Controls communication for remote access.

**Implemented By:** -

#### Input Communication Module (M2)

**Secrets:** The format and structure of the input data (temperature, etc.)

**Services:** Converts the input data into the data structure used by the input parameters module.

**Implemented By:** Communication.cs

**Type of Module:** Abstract Data Type

#### Output Communication Module (M3)

**Secrets:** The format and structure of the output data.

**Services:** Converts the output data into the data structure used by the output parameters module.

**Implemented By:** Communication.cs

**Type of Module:** Abstract Data Type

#### Remote Access Module (M4)

**Secrets:** The implementation and algorithm of remote access. Login info and other credentials required for remote connection.

**Services:** Remote acces to the application for the user.

**Implemented By:** RemoteAccess.cs

**Type of Module:** Abstract Object Type

### 7.2.2 Display Module

**Secrets:** Display output data and and other information to the user.

**Services:** Receives data to be displayed and displays it on the screen for the user to see.

**Implemented By:** -

**Current State Module (M5)**

**Secrets:** The contents of obtaining current system state.

**Services:** Display state of hardware (current temp, current voltage, current sampling rate, etc.)

**Implemented By:** CurrentState.cs

**Type of Module:** Abstract Data Type

**File Output Module (M6)**

**Secrets:** The contents of obtaining correct files for output.

**Services:** Outputs the file the to screen for the user.

**Implemented By:** FileOutput.cs

**Type of Module:** Record

**Graphical Output Module (M7)**

**Secrets:** Obtaining the correct data to produce accurate graphs.

**Services:** Displays the data in a graphical format.

**Implemented By:** Graph.cs

**Type of Module:** Abstract Object Type

## 7.3 Software Decision Module

**Calculation Module (M8)**

**Secrets:** The mathematical equation for calculating resistivity and resistance.

**Services:** Solve the equation for resistivity and resistance respectively and return the result.

**Implemented By:** Calculation.cs

**Type of Module:** Abstract Data Type

### 7.3.1 Validation Module

**Secrets:** Validation criteria for various input streams.

**Services:** Validates the correctness of provided input from the given stream.

**Implemented By:** -

**User Input Validation Module (M9)**

**Secrets:** Validation criteria for user input.

**Services:** Validates the input from the user.

**Implemented By:** UserValidation.cs

**Type of Module:** Abstract Data Type

**Hardware Input Validation Module(M10)**

**Secrets:** Validation criteria for hardware input.

**Services:** Validates the input from the hardware.

**Implemented By:** HardwareValidation.cs

**Type of Module:** Abstract Data Type

# 8 Traceability Matrix

This section shows two traceability matrices: between the modules and the requirements and between the modules and the anticipated changes.

| Req. | Modules |
|---|---|
| R1 | M1, M??, M??, M?? |
| R2 | M??, M?? |
| R3 | M?? |
| R4 | M??, M?? |
| R5 | M??, M??, M??, M??, M??, M?? |
| R6 | M??, M??, M??, M??, M??, M?? |
| R7 | M??, M??, M??, M??, M?? |
| R8 | M??, M??, M??, M??, M?? |
| R9 | M?? |
| R10 | M??, M??, M?? |
| R11 | M??, M??, M??, M?? |

Table 3: Trace Between Anticipated Changes and Modules

# 9 Use Hierarchy Between Modules

In this section, the uses hierarchy between modules is provided. Parnas (1978) said of two programs A and B that A *uses* B if correct execution of B may be necessary for A to complete

the task described in its specification. That is, A *uses* B if there exist situations in which the correct functioning of A depends upon the availability of a correct implementation of B. Figure 1 illustrates the use relation between the modules. It can be seen that the graph is a directed acyclic graph (DAG). Each level of the hierarchy offers a testable and usable subset of the system, and modules in the higher level of the hierarchy are essentially simpler because they use modules from the lower levels.

Figure 1: Use hierarchy among modules
